

AHSAN ULLAH DAUD

Full-Stack Engineer | AI-First Development with Claude Code
Stoke-on-Trent, UK | ahsanullahdaud@gmail.com | ahsanullahdaud.vercel.app
linkedin.com/in/ahsan-ullah-daud-ba7647200 | github.com/ahsanullahdaud
Eligible to work in the UK without sponsorship | Open to hybrid working

PROFILE

Full-stack engineer with three years' commercial experience building, shipping and supporting EZsoft, a multi-tenant web platform used by clients internationally. Own features end to end: from a client conversation or rough brief, through data model, back end and front end, to production deployment and the support that follows. Build AI-first with Claude Code: planned, built, tested and deployed Creator Match, a live product combining an LLM API with the YouTube Data API, in about eight hours of working sessions. Work directly with clients, resolve production issues against a four-hour response target, and prefer getting a working version in front of users quickly and improving it from their feedback.

KEY SKILLS

AI engineering: Claude Code (codebase exploration, plan mode, feature builds, debugging, refactoring, testing, code review, documentation); LLM API integration (Gemini), JSON-schema structured outputs, prompt design, provider-agnostic LLM layer

Front end: React, Next.js (App Router), TypeScript, Tailwind CSS, JavaScript, jQuery, HTML, CSS, Bootstrap

Back end: Next.js route handlers, REST APIs, streamed responses, Zod validation; ASP.NET MVC, .NET Framework, C#, VB.NET, ADO.NET, Razor; ASP.NET Core (in progress via Microsoft Learn)

Data: SQL Server, T-SQL, stored procedures, query optimisation, execution plans; Redis (Upstash) for caching and rate limiting

Integrations: YouTube Data API v3, Gemini API, third-party API integration, API quota and rate-limit management

Delivery: Vercel, Git, GitHub, Vitest, GitHub Actions (basic), code reviews, JIRA, Confluence, Agile delivery

PROJECTS

Creator Match — AI creator-matching tool for brands (personal project)

Oct 2026

Live: creator-match-ahsanullahdaud.vercel.app | Code: github.com/ahsanullahdaud/creator-match

- Built and shipped a live web app that turns a brand brief into a ranked shortlist of ten YouTube creators, each with a fit score, reasons, concerns and a draft outreach message. A new brief completes in about 12 seconds end to end; cached and example briefs return in under a second.
- Stack: Next.js 16, React, TypeScript and Tailwind on Vercel; Gemini API with JSON-schema structured outputs for query generation and scoring; YouTube Data API v3 for channels and statistics; Upstash Redis for caching and rate limiting.
- Built AI-first with Claude Code in about eight hours of working sessions: plan mode produced the design and build order before any code, then one reviewed step at a time through implementation, debugging, testing, refactoring and documentation, with the first production deploy at step two.
- Designed around hard free-tier limits (100 YouTube searches and 500 LLM requests a day): a 7-day cache keyed on a normalised brief, per-visitor limits, global daily budgets that fail closed, batched scoring that cut LLM requests per brief from 11 to 3, and precomputed examples that still work when every quota is spent or Redis is down.
- Made the product decisions: replaced the suggested passcode gate with an open page and visitor limits so anyone with the link can try it, moved deployment from the last step to the second, and switched LLM provider mid-build behind a provider-agnostic module.
- 158 automated tests (Vitest) with the LLM and YouTube clients mocked so the suite spends no quota; git history scanned for secrets before the repository went public; a build log records each step, its timings and the debugging behind it.

Price comparison tool — private e-commerce client (freelance)

- Built a React price comparison tool for a private e-commerce client using AI-assisted development, working directly with the client from requirements through to delivery.

EXPERIENCE

Full Stack Engineer — EZ Consultants & ERP Solutions (EZsoft)

Mar 2025 – Present

Remote (Islamabad-based software house serving clients internationally)

- Develop and own features on EZsoft, a multi-tenant web platform (ASP.NET MVC, SQL Server) serving clients internationally across finance, HR, payroll, sales, stock and POS modules.
- Take features from loosely defined client requests to production: gather requirements directly from clients and implementation staff, design the data model, build the back end and front end, deploy, then iterate on user feedback.
- Used AI-assisted development to replace hundreds of manually prepared SDLC PDF reports with a feature that generates them in a few clicks, delivered in a few days.
- Use Claude Code on selected tasks to explore unfamiliar parts of the codebase, plan changes, debug issues and refactor legacy modules.
- Stay accountable for what I ship: resolve support tickets raised via JIRA, the implementation team and direct client channels within a four-hour response target; handled 10+ urgent out-of-hours production incidents, diagnosing root causes and restoring service.
- Integrate third-party APIs and services into the platform, and debug issues across those integrations when they arise in production.
- Built and enhanced finance functionality, including the General Ledger module, accounts payable/receivable reporting and customer invoice templates for clients across multiple industries.
- Write and tune complex T-SQL queries and stored procedures for reporting and period-end processes, using execution plans to resolve slow queries.
- Maintain and modernise legacy modules, review work from junior developers, and document systems and processes for the implementation team.

Software Developer — EZ Consultants & ERP Solutions (EZsoft)

Feb 2021 – Jul 2022

Islamabad, Pakistan (on-site)

- Worked across the full stack of the EZsoft product as a junior developer: ASP.NET MVC (VB.NET), Razor views, JavaScript/jQuery and SQL Server.
- Built and extended modules for accounts, payroll, inventory, production and export to client requirements, from database tables and stored procedures through to front-end screens.
- Fixed bugs and handled day-to-day support requests in a small, fast-moving Agile team using Git, code reviews and JIRA.

EDUCATION

MSc Computer Science — University of Hertfordshire, UK

Sep 2022 – Oct 2024

- Final project: web application (ASP.NET MVC, SQL Server) assessing an organisation's staff exposure to cyber-security threats, with staff authentication, a 30-question assessment, individual risk scoring and organisation-level recommendations.

BS (Hons) Computer Science — Capital University of Science & Technology, Pakistan

Sep 2015 – Jan 2020
